Cancer Clusters
Frequently Asked Questions

Question
Do you have information on the Coram/Mt. Sinai/Port Jefferson cancer investigation?

Answer
The New York State Cancer Surveillance Improvement Initiative identified an area on Long Island, New York, as having a higher than expected incidence of breast cancer between 1993 and 1997. A follow-up report about the investigation and analyses was released in 2006. You can find the complete report and other information about this investigation at the NYS Cancer Surveillance Improvement Initiative site. This study was funded by the New York State Department of Health.
