

A DECOMPOSITION OF A LATIN SQUARE OF ORDER 6 INTO F-SQUARES
AND SOME OBSERVATIONS ON ORTHOGONALITY IN F-SQUARES

BU-549-M

by

February, 1975

W. T. Federer

Abstract

A given latin square of order 6 is decomposed into two sets of single degree of freedom contrasts and resulting F-squares are obtained from the single degree of freedom contrasts. The resulting squares are considered in terms of the published definition (by A. Hedayat) of F-squares and found lacking. A definition of orthogonal F-squares for unordered pairs is given and several sets of four $F(1^3, 1^3; 6)$ -squares can be found to satisfy this definition. It is considered impossible to obtain a pair of orthogonal $F(1^3, 1^3; 6)$ -squares using Hedayat's definition.

A DECOMPOSITION OF A LATIN SQUARE OF ORDER 6 INTO F-SQUARES
AND SOME OBSERVATIONS ON ORTHOGONALITY IN F-SQUARES

BU-549-M

by

W. T. Federer

1. A 6 × 6 Latin Square

Consider the following latin square of order 6, which may be constructed as the Kronecker product of a latin square of order 2 and one of order 3:

$$\begin{array}{|c|c|} \hline 0 & 1 \\ \hline 1 & 0 \\ \hline \end{array} \otimes \begin{array}{|c|c|c|} \hline 0 & 1 & 2 \\ \hline 1 & 2 & 0 \\ \hline 2 & 0 & 1 \\ \hline \end{array} = \begin{array}{|c|c|c|c|c|c|} \hline A & B & C & D & E & F \\ \hline B & C & A & E & F & D \\ \hline C & A & B & F & D & E \\ \hline D & E & F & A & B & C \\ \hline E & F & D & B & C & A \\ \hline F & D & E & C & A & B \\ \hline \end{array}$$

Construct a set of orthogonal contrasts among the letters as follows:

Contrast	Letters					
	A	B	C	D	E	F
C1	1	1	1	1	1	1
C2	1	1	1	-1	-1	-1
C3	1	1	-2	2	-1	-1
C4	-1	1	0	0	-1	1
C5	-2	1	1	1	1	-2
C6	0	1	-1	-1	1	0

Note that the above set of contrasts was selected starting with C2 since this contrast immediately forms an $F(1^3, 1^3; 6)$ -square where 1^3 means that a symbol occurs 3 times in rows and 3 times in columns, the number of one's gives the number of symbols, and 6 is the order of the square. Thus, if all letters receiving a +1 in

C2 are denoted as one, and if all letters receiving a -1 in C2 are designated as zero, then the following results:

$$F_{C_2}(1^3, 1^3; 6) = \begin{array}{|c|} \hline \begin{array}{cccccc} 1 & 1 & 1 & 0 & 0 & 0 \\ 1 & 1 & 1 & 0 & 0 & 0 \\ 1 & 1 & 1 & 0 & 0 & 0 \\ \hline 0 & 0 & 0 & 1 & 1 & 1 \\ \hline 0 & 0 & 0 & 1 & 1 & 1 \\ \hline 0 & 0 & 0 & 1 & 1 & 1 \\ \hline \end{array} \\ \hline \end{array}$$

Likewise, if we place a one where the plus signs occur and a zero where the minus signs occur in C3, we obtain the following F-square:

$$F_{C_3}(1^3, 1^3; 6) = \begin{array}{|c|} \hline \begin{array}{cccccc} 1 & 1 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 & 1 & 0 \\ \hline 1 & 0 & 0 & 1 & 1 & 0 \\ \hline 0 & 0 & 1 & 1 & 0 & 1 \\ \hline 0 & 1 & 0 & 0 & 1 & 1 \\ \hline \end{array} \\ \hline \end{array}$$

Similarly, from C5 we obtain:

$$F_{C_5}(1^4, 1^2; 6) = \begin{array}{|c|} \hline \begin{array}{cccccc} 0 & 1 & 1 & 1 & 1 & 0 \\ 1 & 1 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 1 & 1 \\ \hline 1 & 1 & 0 & 0 & 1 & 1 \\ \hline 1 & 0 & 1 & 1 & 1 & 0 \\ \hline 0 & 1 & 1 & 1 & 0 & 1 \\ \hline \end{array} \\ \hline \end{array}$$

where the symbol 1 occurs 4 times in each row and column, and the symbol zero occurs twice in each row and column.

The remaining two contrasts result in rather peculiar F-squares in that $\frac{1}{3}$ of the cells are blank. The "F-squares" are:

$$F_{C_4}(1^2, 1^2, -, -; 6) = \begin{array}{|c|c|c|c|c|c|} \hline 0 & 1 & - & - & 0 & 1 \\ \hline 1 & - & 0 & 0 & 1 & - \\ \hline - & 0 & 1 & 1 & - & 0 \\ \hline - & 0 & 1 & 0 & 1 & - \\ \hline 0 & 1 & - & 1 & - & 0 \\ \hline 1 & - & 0 & - & 0 & 1 \\ \hline \end{array} \quad \text{and} \quad F_{C_6}(1^2, 1^2, -, -; 6) = \begin{array}{|c|c|c|c|c|c|} \hline - & 1 & 0 & 0 & 1 & - \\ \hline 1 & 0 & - & 1 & - & 0 \\ \hline 0 & - & 1 & - & 0 & 1 \\ \hline 0 & 1 & - & - & 1 & 0 \\ \hline 1 & - & 0 & 1 & 0 & - \\ \hline - & 0 & 1 & 0 & - & 1 \\ \hline \end{array}$$

At this point let us count the number of occurrences of symbols with each other, where the pair (i,j) denotes the symbol i in the first square and the symbol j in the second square:

Square (i) vs. Square (j)	(i,j)			
	(0,0)	(0,1)	(1,0)	(1,1)
C2 vs. C3	12	6	6	12
C4	6	6	6	6
C5	6	12	6	12
C6	6	6	6	6
C3 vs. C4	6	6	6	6
C5	6	12	6	12
C6	6	6	6	6
C4 vs. C5	6	6	6	6
C6	0	6	0	6
C5 vs. C6	0	0	12	12

The question now arises about the orthogonality of the above five F-squares. In other words, what is meant by orthogonality of F-squares and is the above method appropriate for constructing F-squares? The treatment contrasts do form an orthogonal set.

2. Treatment Contrasts Using Orthogonal Polynomials

Using orthogonal polynomial coefficients, the contrasts among the six letters are:

Contrast	Letters					
	A	B	C	D	E	F
mean	1	1	1	1	1	1
1 = linear (-)	5	3	1	-1	-3	-5
2 = quadratic	5	-1	-4	-4	-1	5
3 = cubic	-5	7	4	-4	-7	5
4 = quartic	1	-3	2	2	-3	1
5 = quintic	-1	5	-10	10	-5	1

If we now insert a one wherever a positive coefficient occurs and a zero wherever a negative coefficient occurs for the letter in the above latin square, we obtain the following five F-squares:

$$F_1(1^3, 1^3; 6) = \begin{array}{|c|} \hline \begin{array}{cccccc} 1 & 1 & 1 & 0 & 0 & 0 \\ 1 & 1 & 1 & 0 & 0 & 0 \\ 1 & 1 & 1 & 0 & 0 & 0 \\ \hline 0 & 0 & 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 1 & 1 & 1 \end{array} \\ \hline \end{array}, \quad F_2(1^2, 1^4; 6) = \begin{array}{|c|} \hline \begin{array}{cccccc} 1 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 \\ \hline 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 & 1 & 0 \end{array} \\ \hline \end{array},$$

$$F_3(1^3, 1^3; 6) = \begin{array}{|c|} \hline \begin{array}{cccccc} 0 & 1 & 1 & 0 & 0 & 1 \\ 1 & 1 & 0 & 0 & 1 & 0 \\ 1 & 0 & 1 & 1 & 0 & 0 \\ \hline 0 & 0 & 1 & 0 & 1 & 1 \\ 0 & 1 & 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 & 0 & 1 \end{array} \\ \hline \end{array}, \quad F_4(1^4, 1^2; 6) = \begin{array}{|c|} \hline \begin{array}{cccccc} 1 & 0 & 1 & 1 & 0 & 1 \\ 0 & 1 & 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 & 1 & 0 \\ \hline 1 & 0 & 1 & 1 & 0 & 1 \\ 0 & 1 & 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 & 1 & 0 \end{array} \\ \hline \end{array},$$

$$\text{and } F_5(1^3, 1^3; 6) = \begin{array}{|c|} \hline \begin{array}{cccccc} 0 & 1 & 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 1 & 1 & 0 \\ \hline 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 1 & 1 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 & 1 \end{array} \\ \hline \end{array}.$$

As before, let us count the frequency of occurrences (i,j) for all pairs of the five squares above.

Square (i) vs. Square (j)	(i,j)			
	(0,0)	(0,1)	(1,0)	(1,1)
F_1 vs. F_2	12	6	12	6
F_3	12	6	6	12
F_4	6	12	6	12
F_5	6	12	12	6
F_2 vs. F_3	12	12	6	6
F_4	12	12	0	12
F_5	12	12	6	6
F_3 vs. F_4	6	12	6	12
F_5	12	6	6	12
F_4 vs. F_5	6	6	12	12

3. Orthogonality in F-Squares

Hedayat [1969] gives the following definition for mutually orthogonal F-squares:

Definition 3.1. Given an F-square $F_1(\lambda_1, \lambda_2, \dots, \lambda_k; n)$ on a k-set $\Sigma = \{a_1, a_2, \dots, a_k\}$ and an F-square $F_2(\mu_1, \mu_2, \dots, \mu_t; n)$ on a t-set $\Omega = \{b_1, b_2, \dots, b_t\}$, we say that F_2 is an orthogonal mate for F_1 (and write $F_1 \perp F_2$) if upon superposition of F_2 on F_1 , a_i with frequency in rows and columns of λ_i in F_1 appears $\lambda_i \mu_j$ times with b_j which occurs with frequency μ_j in the rows and in the columns of F_2 .

To illustrate the above definition, consider the following set of three mutually orthogonal F-squares of order $n = 5$ (the superscripts of the symbols are the λ_i and μ_j):

$F_1(1^2, 1^2, 1; 5)$	$F_2(1, 1, 1^3; 5)$	$F_3(1, 1, 1, 1^2; 5)$																																																																													
<table style="width: 100%; text-align: center;"> <tr><td>1</td><td>2</td><td>3</td><td>1</td><td>2</td></tr> <tr><td>2</td><td>1</td><td>2</td><td>3</td><td>1</td></tr> <tr><td>1</td><td>2</td><td>1</td><td>2</td><td>3</td></tr> <tr><td>3</td><td>1</td><td>2</td><td>1</td><td>2</td></tr> <tr><td>2</td><td>3</td><td>1</td><td>2</td><td>1</td></tr> </table>	1	2	3	1	2	2	1	2	3	1	1	2	1	2	3	3	1	2	1	2	2	3	1	2	1	⊥	<table style="width: 100%; text-align: center;"> <tr><td>1</td><td>2</td><td>3</td><td>3</td><td>3</td></tr> <tr><td>3</td><td>3</td><td>1</td><td>2</td><td>3</td></tr> <tr><td>2</td><td>3</td><td>3</td><td>3</td><td>1</td></tr> <tr><td>3</td><td>1</td><td>2</td><td>3</td><td>3</td></tr> <tr><td>3</td><td>3</td><td>3</td><td>1</td><td>2</td></tr> </table>	1	2	3	3	3	3	3	1	2	3	2	3	3	3	1	3	1	2	3	3	3	3	3	1	2	⊥	<table style="width: 100%; text-align: center;"> <tr><td>1</td><td>2</td><td>3</td><td>4</td><td>4</td></tr> <tr><td>3</td><td>4</td><td>4</td><td>1</td><td>2</td></tr> <tr><td>4</td><td>1</td><td>2</td><td>3</td><td>4</td></tr> <tr><td>2</td><td>3</td><td>4</td><td>4</td><td>1</td></tr> <tr><td>4</td><td>4</td><td>1</td><td>2</td><td>3</td></tr> </table>	1	2	3	4	4	3	4	4	1	2	4	1	2	3	4	2	3	4	4	1	4	4	1	2	3
1	2	3	1	2																																																																											
2	1	2	3	1																																																																											
1	2	1	2	3																																																																											
3	1	2	1	2																																																																											
2	3	1	2	1																																																																											
1	2	3	3	3																																																																											
3	3	1	2	3																																																																											
2	3	3	3	1																																																																											
3	1	2	3	3																																																																											
3	3	3	1	2																																																																											
1	2	3	4	4																																																																											
3	4	4	1	2																																																																											
4	1	2	3	4																																																																											
2	3	4	4	1																																																																											
4	4	1	2	3																																																																											

Counting occurrences of symbols in one square with those in another, we obtain:

<table style="width: 100%; text-align: center;"> <tr><td></td><td colspan="3">F_2</td></tr> <tr><td>F_1</td><td>1</td><td>2</td><td>3</td></tr> <tr><td>1</td><td>2</td><td>2</td><td>6</td></tr> <tr><td>2</td><td>2</td><td>2</td><td>6</td></tr> <tr><td>3</td><td>1</td><td>1</td><td>3</td></tr> </table>		F_2			F_1	1	2	3	1	2	2	6	2	2	2	6	3	1	1	3	<table style="width: 100%; text-align: center;"> <tr><td></td><td colspan="4">F_3</td></tr> <tr><td>F_1</td><td>1</td><td>2</td><td>3</td><td>4</td></tr> <tr><td>1</td><td>2</td><td>2</td><td>2</td><td>4</td></tr> <tr><td>2</td><td>2</td><td>2</td><td>2</td><td>4</td></tr> <tr><td>3</td><td>1</td><td>1</td><td>1</td><td>2</td></tr> </table>		F_3				F_1	1	2	3	4	1	2	2	2	4	2	2	2	2	4	3	1	1	1	2	<table style="width: 100%; text-align: center;"> <tr><td></td><td colspan="4">F_3</td></tr> <tr><td>F_2</td><td>1</td><td>2</td><td>3</td><td>4</td></tr> <tr><td>1</td><td>1</td><td>1</td><td>1</td><td>2</td></tr> <tr><td>2</td><td>1</td><td>1</td><td>1</td><td>2</td></tr> <tr><td>3</td><td>3</td><td>3</td><td>3</td><td>6</td></tr> </table>		F_3				F_2	1	2	3	4	1	1	1	1	2	2	1	1	1	2	3	3	3	3	6
	F_2																																																																							
F_1	1	2	3																																																																					
1	2	2	6																																																																					
2	2	2	6																																																																					
3	1	1	3																																																																					
	F_3																																																																							
F_1	1	2	3	4																																																																				
1	2	2	2	4																																																																				
2	2	2	2	4																																																																				
3	1	1	1	2																																																																				
	F_3																																																																							
F_2	1	2	3	4																																																																				
1	1	1	1	2																																																																				
2	1	1	1	2																																																																				
3	3	3	3	6																																																																				

Note that the ratio of $\mu_1 : \mu_2 : \mu_3 : \dots : \mu_t$ remains constant in each row and that the ratio of $\lambda_1 : \lambda_2 : \lambda_3 : \dots : \lambda_k$ remains constant in each column. Note also that these are the superscripts in the F-squares involved and that the entries in the table are $\lambda_i \mu_j$.

As a second example, consider the following two F-squares of order 6:

$F_1(1^2, 1^2, 1^2; 6)$	$F_2(1^2, 1^2, 1^2; 6)$																																																																									
<table style="width: 100%; text-align: center;"> <tr><td>A</td><td>B</td><td>C</td><td>A</td><td>B</td><td>C</td></tr> <tr><td>B</td><td>C</td><td>A</td><td>B</td><td>C</td><td>A</td></tr> <tr><td>C</td><td>A</td><td>B</td><td>C</td><td>A</td><td>B</td></tr> <tr><td>A</td><td>B</td><td>C</td><td>A</td><td>B</td><td>C</td></tr> <tr><td>B</td><td>C</td><td>A</td><td>B</td><td>C</td><td>A</td></tr> <tr><td>C</td><td>A</td><td>B</td><td>C</td><td>A</td><td>B</td></tr> </table>	A	B	C	A	B	C	B	C	A	B	C	A	C	A	B	C	A	B	A	B	C	A	B	C	B	C	A	B	C	A	C	A	B	C	A	B	⊥	<table style="width: 100%; text-align: center;"> <tr><td>A</td><td>B</td><td>C</td><td>A</td><td>B</td><td>C</td></tr> <tr><td>C</td><td>A</td><td>B</td><td>C</td><td>A</td><td>B</td></tr> <tr><td>B</td><td>C</td><td>A</td><td>B</td><td>C</td><td>A</td></tr> <tr><td>A</td><td>B</td><td>C</td><td>A</td><td>B</td><td>C</td></tr> <tr><td>C</td><td>A</td><td>B</td><td>C</td><td>A</td><td>B</td></tr> <tr><td>B</td><td>C</td><td>A</td><td>B</td><td>C</td><td>A</td></tr> </table>	A	B	C	A	B	C	C	A	B	C	A	B	B	C	A	B	C	A	A	B	C	A	B	C	C	A	B	C	A	B	B	C	A	B	C	A
A	B	C	A	B	C																																																																					
B	C	A	B	C	A																																																																					
C	A	B	C	A	B																																																																					
A	B	C	A	B	C																																																																					
B	C	A	B	C	A																																																																					
C	A	B	C	A	B																																																																					
A	B	C	A	B	C																																																																					
C	A	B	C	A	B																																																																					
B	C	A	B	C	A																																																																					
A	B	C	A	B	C																																																																					
C	A	B	C	A	B																																																																					
B	C	A	B	C	A																																																																					

The frequencies of occurrence of symbols in the two squares are:

	F_2		
F_1	A	B	C
A	4	4	4
B	4	4	4
C	4	4	4

It should be noted that Anderson, Federer, and Seiden [1974] were able to obtain a set of 8 mutually orthogonal $F(1^3, 1^2, 1^2; 6)$ -squares and that no additional $F(1^3, 1^2, 1^2; 6)$ could be added to this set, which means that the set is locked in the jargon of this area.

Most of the pairs of F-squares presented thus far do not fit this definition. In fact, the following is conjectured:

It is impossible to obtain two orthogonal (in the sense of definition 3.1) $F(1^3, 1^3; 6)$ -squares. For example, consider the $F_{C2}(1^3, 1^3; 6)$ -square. Note that F_{C2} is orthogonal to a peculiar sort of "F-square":

$F_{C2}(1^3, 1^3; 6)$	"F()"																																																																								
<table style="width: 100%; border-collapse: collapse;"> <tr><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td></tr> <tr><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td></tr> <tr><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td></tr> <tr style="border-top: 1px dashed black;"><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td></tr> </table>	1	1	1	0	0	0	1	1	1	0	0	0	1	1	1	0	0	0	0	0	0	1	1	1	0	0	0	1	1	1	0	0	0	1	1	1	<table style="width: 100%; border-collapse: collapse;"> <tr><td>1</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td></tr> <tr><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>1</td></tr> <tr style="border-top: 1px dashed black;"><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td></tr> <tr><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td></tr> <tr><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td></tr> </table>	1	1	0	1	1	0	1	0	1	1	0	1	0	1	1	0	1	1	0	0	1	0	0	1	0	1	0	0	1	0	1	0	0	1	0	0
1	1	1	0	0	0																																																																				
1	1	1	0	0	0																																																																				
1	1	1	0	0	0																																																																				
0	0	0	1	1	1																																																																				
0	0	0	1	1	1																																																																				
0	0	0	1	1	1																																																																				
1	1	0	1	1	0																																																																				
1	0	1	1	0	1																																																																				
0	1	1	0	1	1																																																																				
0	0	1	0	0	1																																																																				
0	1	0	0	1	0																																																																				
1	0	0	1	0	0																																																																				

The occurrences of symbols in the two squares are:

	"F"	
F_{C2}	0	1
0	9	9
1	9	9

Note that in "F" the symbol one occurs 4 times in rows 1, 2, and 3 and twice in the remaining rows. In columns each symbol occurs 3 times. Hence symbols and columns are orthogonal, rows and columns are orthogonal, but rows and symbols are not orthogonal. It is considered impossible to find two orthogonal $F(1^3, 1^3; 6)$ squares of the nature of F_{C2} , and to obtain frequencies of 9 as in the above table.

If we were to alter the definition of orthogonality as follows, we can obtain many sets of mutually orthogonal $F(1^3, 1^3; 6)$ -squares.

Definition 3.2. Two F-squares are considered to be orthogonal for unordered pairs if $\mu_i \lambda_j + \mu_j \lambda_i = \mu_i \mu_i = \lambda_j \lambda_j$ for all i and j as in definition 3.1.

As an example, consider the following four $F(1^3, 1^3; 6)$ -squares:

$F_1(1^3, 1^3; 6) = F_{C2}$

1	1	1	0	0	0
1	1	1	0	0	0
1	1	1	0	0	0
0	0	0	1	1	1
0	0	0	1	1	1
0	0	0	1	1	1

$F_2(1^3, 1^3; 6)$

1	1	0	0	0	1
1	0	1	0	1	0
0	1	1	1	0	0
0	0	1	1	1	0
0	1	0	1	0	1
1	0	0	0	1	1

$F_3(1^3, 1^3; 6)$

0	1	1	1	0	0
1	1	0	0	0	1
1	0	1	0	1	0
0	0	1	1	1	0
0	1	0	1	0	1
1	0	0	0	1	1

$F_4(1^3, 1^3; 6)$

1	0	1	0	1	0
0	1	1	1	0	0
1	1	0	0	0	1
0	0	1	1	1	0
0	1	0	1	0	1
1	0	0	0	1	1

The occurrences of symbols in one square with those in another are given below:

Pair of squares	Occurrences		
	(1,1)	(0,0)	(0,1) and (1,0)
F ₁ vs. F ₂	12	12	6 + 6 = 12
F ₃	12	12	6 + 6 = 12
F ₄	12	12	6 + 6 = 12
F ₂ vs. F ₃	12	12	6 + 6 = 12
F ₄	12	12	6 + 6 = 12
F ₃ vs. F ₄	12	12	6 + 6 = 12

Thus here is a set of 4 mutually orthogonal $F(1^3, 1^3; 6)$ -squares for unordered pairs. Several such sets are available upon noting the nature of the construction of the above F-squares:

There are many sets of A_i and B_j and these can be combined in several ways. It was not possible to obtain more than four such sets.

It is possible to obtain at least 8 mutually orthogonal $F(1^2, 1^4; 6)$ -squares in the sense of definition 3.1. These may be obtained from the 8 $F(1^2, 1^2, 1^2; 6)$ -squares of Anderson, Federer, and Seiden [1974]. The procedure is to set all 2 elements equal to one and to leave the zero and one elements in their original form.

It is known that F_{C2} in the form $\begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix} \times \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$ is orthogonal to the 8 $F(1^2, 1^2, 1^2; 6)$ -squares. It is not known if there are additional $F(1^2, 1^4; 6)$ -squares and $F(1, 1^5; 6)$ -squares which are mutually orthogonal to the 8 and to F_{C2} . An attempt is being made to find such squares. Since $F_{C5}(1^4, 1^2; 6)$ is orthogonal to $F_{C2}(1^3, 1^3; 6)$ in the sense of definition 3.1, it is a candidate for the above search.
