

8. The changing nature of the faculty and faculty employment practices

Ronald G. Ehrenberg

INTRODUCTION

The nature of faculty employment practices at American colleges and universities is changing rapidly. So too is the gender, racial and ethnic composition of American faculty members. These changes, along with the growing importance and costs of scientific research, the increased commercialization of faculty research, the elimination of mandatory retirement for tenured faculty members and the growing costs of retiree health insurance, the growing salary differentials across universities and academic fields within a university, and the growth of collective bargaining for tenured and tenure-track faculty and graduate assistants at public universities and now adjuncts at private universities, have put enormous stresses on our nation's academic institutions and their leaders. The discussion that follows explains why.

THE GROWTH IN CONTINGENT FACULTY

During the last three decades there has been a significant growth in the share of faculty members at American colleges and universities who are employed in part-time or full-time non-tenure-track positions (Anderson, 2002; Baldwin and Chronister, 2001; Conley et al., 2004; Ehrenberg and Zhang, 2005a). In 1975 full-time tenured and tenure-track faculty members were 56.8 per cent of the faculty nationwide at America's 2-year and 4-year colleges and universities, while full-time non-tenure-track faculty and part-time faculty were 13 per cent and 30.2 per cent respectively. By 2003 full-time tenured and tenure-track faculty had fallen to 35.1 per cent, while the latter two categories had risen to 18.7 per cent and 46.3 per cent respectively (Curtis, 2005). This substitution of *contingent* or *contract* faculty for tenured and tenure-track faculty is at least partially due to the growing financial pressures faced by public and private higher education institutions, partially

due to the lower costs of hiring non-tenure-track faculty members and partially due to the increased flexibility that hiring such faculty members gives academic institutions in the face of uncertain economic times and the end of mandatory retirement for tenure-track faculty members (that took place in 1994) (Ehrenberg and Zhang, 2005a; Monks, 2004).

To give the reader a sense of the role that contingent faculty play at major American universities, Table 8.1 presents information on the distribution of faculty types at selected private universities during the academic year 2003–2004. That year less than 25 per cent of the faculty members were contingent faculty at Cornell and Rochester; however, 50 per cent or more of the faculty members were contingent faculty at Boston College, Brown, NYU and Tufts. At the latter set of institutions many of these contingent faculty members were part-time faculty.

Of course part-time faculty members teach fewer classes than full-time faculty members and it is interesting to ask what percentage of undergraduate credit hours at an academic institution are generated by contingent faculty. Such information is not readily available for private institutions, but data from the State University of New York system show that between the fall of 1992 and the fall of 2001 the percentage of undergraduate credit hours taught by faculty members with tenure or on tenure tracks at the four university centers fell from 81 per cent to 58.4 per cent, a decrease of over 22 percentage points (Ehrenberg and Klaff, 2003, Table 2).¹ Moreover,

Table 8.1 Numbers and percentages of faculty in different categories at selected private universities in 2003–2004^a

Institution	Total faculty size	Tenured and tenure-track (percentage)	Full-time non-tenure track (percentage)	Part-time non-tenure track (percentage)
Boston College	1089	548 (50)	131 (12)	410 (38)
Brown	902	468 (52)	285 (32)	149 (17)
Cornell	1940	1477 (76)	348 (18)	115 (6)
NYU	5083	1292 (25)	630 (12)	3162 (62)
Rochester	591	465 (79)	100 (17)	26 (4)
Tufts	1036	359 (35)	275 (27)	402 (39)

Note: ^a Excluding medical college faculty.

Source: Report from the *ad hoc* Committee on Contract Faculty to the Provost and the Faculty Senate, Brandeis University (17 March 2005), Appendix Table A-2 (available at www.brandeis.edu/departments/provost/contract_faculty_comm.html). The data come from the 2003 IPEDs EAP Survey (available at <http://nces.ed.gov/ipeds>). The data are as reported by the institutions. Employees who do not have faculty status are excluded, as are graduate assistants.

between the fall of 1994 and the fall of 2004 the number of full-time faculty members at the four university centers (including those not on tenure tracks) fell by 251 from 4348 to 4097, while the number of part-time faculty members increased by 616 from 1283 to 1899 (Office of Institutional Research and Analysis, 2005). Given that the number of full-time equivalent students at the university centers increased from 62 179 to 72 571 during the period, it is clear that the instructional workload was being shifted onto the backs of part-time faculty.²

There are a number of reasons that the public and university leaders should be concerned about such shifts in who is teaching our undergraduate students.³ First, while it would be delightful if we could substitute lower paid part-time and full-time non-tenure-track faculty for more costly tenure-track faculty and not influence the quality of education that undergraduate students receive, a growing body of research suggests that on balance there is a cost to students of this type of substitution. For example, Liang Zhang and I analyzed institutional level panel data from the *College Board* and other sources and found that increases in a 4-year institution's usage of part-time or full-time non-tenure-track faculty is associated, other factors held constant, with a decline in its students' graduation rates (Ehrenberg and Zhang, 2005b). Similarly, using a unique individual record data set for all students enrolled in 4-year public higher education institutions in Ohio, Bettinger and Long (forthcoming) found that students with adjunct-heavy course schedules in their first year of study are less likely to persist at the institution into the second year. Other factors held constant.

Why might such findings occur? After all, many non-tenure-track faculty are dedicated teachers and, without any research expectations placed on them, can devote themselves fully to teaching. However, full-time non-tenure-track faculty teaching loads are often higher than tenure-track faculty teaching loads, which may leave the former less, rather than more, time for individual students. Part-time faculty members, especially in urban areas, often must find employment at multiple institutions to make ends meet and have little time (and often no place) to meet students outside class. The full-time tenured and tenure-track faculty members, who may be more connected to their institution and more up to date on their department's curriculum, may also be better prepared to advise students.

The term contingent faculty is probably a misnomer, because many full-time non-tenure-track faculty are in fact quasi-permanent employees who have multi-year contracts and for whom there often is a career path. For example, at Cornell University lecturers typically have multi-year contracts and, after a period of service, can be promoted to the rank of senior lecturer. A number of research universities, including Duke, Emory and NYU, are experimenting with creating a more prestigious 'professor of practice'

career path in which faculty members who specialize in teaching are paid salaries much closer to the average tenure-track salaries in their fields than lecturers are paid, receive the same benefits as their tenure-track colleagues (but often not sabbaticals) and are employed on renewable long-term contracts (Fogg, 2004).

Whether such a two-tier system, with lower (but better than now) paid teaching faculty who have higher teaching loads than other faculty, will be a direction in which more universities will move is unclear. If they do so the financial savings to universities from substituting away from tenure-track faculty will be smaller than it currently is. To the extent that the undergraduate teaching at an institution is done by non-tenure-track faculty without research responsibilities, undergraduate students will miss out on one of the major reasons for coming to a research university – being exposed to great researchers and the research process. Indeed, if we view one of the important roles of research universities as encouraging undergraduate students to consider undertaking advanced study in the disciplines, the failure to involve our undergraduate students in research will reduce the flow of American college graduates into PhD programs (Ehrenberg, 2005a).

Indeed, the fraction of PhD degrees granted in the United States that go to American citizens and permanent residents has been declining for decades. In 1973 less than 10 per cent of PhDs went to temporary residents of the United States; by 2003 this had risen to 26 per cent. Virtually all of the increase in the total number of PhDs produced during the 30-year period has come from the growth in foreign PhD students; the number of American students receiving PhDs remained essentially flat in spite of large increases in the number of American college graduates. Moreover, in key science and engineering fields, the percentage of PhD degrees now granted to foreign students is much higher. In 2003 38 per cent of all the PhDs in the physical sciences and 55 per cent of all the PhDs in engineering granted by American colleges and universities went to foreign students (Hoffer et al., 2004, Table 2).

Part of the decline in the interest of American students in pursuing PhDs is undoubtedly due to the reduction in the likelihood that new PhDs will obtain tenure-track positions, because of the growing use of contingent faculty positions. Increasing time to degrees, coupled with the increasing need for multiple multi-year, relatively low-paid postdoctoral appointments in many science and engineering fields before tenure-track positions can be obtained, has also increased PhD students' discontent and led to the growing unionization of graduate students in public higher education.⁴ So a new generation of PhDs will have very different attitudes towards collective bargaining from those of the older faculty whom they are replacing.

The lower salaries and benefits that contingent faculty receive has also led to a growing movement to have contingent faculty covered by collective

bargaining agreements. Although tenure-track faculty at private colleges and universities at which the faculty have managerial responsibilities are precluded from organizing under the National Labor Relations Board's (NLRB) *Yeshiva* decision in July 2002, NYU became the first major private university in the nation in which an adjunct-only union was certified as a bargaining agent by the NLRB (Smallwood, 2002). While the university has publicly painted the pay increases, health benefits, pension benefits and job security arrangements that were negotiated in the contract as a win-win situation, collective bargaining contracts constrain the freedom of university administrators to manage their institutions as they see fit.⁵

WHO WILL BE THE FACULTY OF THE FUTURE?

In 1973, 18 per cent of all new PhDs in the United States were female; by 2003 this percentage had risen to 45.3 per cent. The female share of PhDs has risen in all fields, even in traditionally male dominated fields such as the physical sciences and engineering (Hoffer et al., 2004, Table 7). However, in spite of the growing numbers of new female PhDs, females are under-represented on the faculty of most major American research universities, especially in the science and engineering fields, and are more likely to be found on the faculty of liberal arts colleges. For example, in economics, females represented 15 per cent of the tenured and tenure-track faculty at doctorate granting institutions but 27.7 per cent at liberal arts colleges (*Newsletter of the Committee on the Status of Women in the Economics Profession*, 2005, Tables 2 and 4).

The under-representation of female faculty at research universities may be due to a number of factors. It may represent female PhDs' preferences for teaching rather than research. It may represent perceptions by females that research universities are not hospitable environments for them. It may represent perceptions by females that there is more gender discrimination in hiring and promotion decisions at research universities or the actuality of more gender discrimination at research universities. Finally, it may represent the difficulty faced by female faculty members in combining families and careers at research universities.

A recent study suggests that family issues are an important component of the explanation (Mason and Goulden, 2004). This study analyzed data from the *Survey of Doctorate Recipients*, a large biennial national longitudinal study that follows the careers of about 160 000 PhD recipients. It focused on the career histories of individuals who received PhDs between 1978 and 1984, started their careers at universities and were still working in academia 12 to 14 years later. It found that men who had children within

5 years of receiving their PhDs were 38 per cent more likely to have received tenure than their female counterparts who had children within 5 years of receiving their PhDs. While 70 per cent of the male faculty members who received tenure were married with children, only 44 per cent of female faculty members who received tenure were married with children; moreover female faculty members with tenure were twice as likely as male faculty members with tenure to be single. It also found that only one in three women who took a university job before having children ever became a mother during the period and that women who were married at the time they began their first academic jobs were more likely than their male counterparts to get divorced or separated.

Not surprisingly then, in an attempt to increase the attractiveness to both young female and male PhDs of faculty careers at research universities, a number of major universities have launched efforts to make their institutions more 'family friendly'. One notable example is the University of California system, which, with the help of the Alfred P. Sloan Foundation, has developed a set of policies that it calls 'The UC Family Friendly Edge' (University of California, 2005). These policies include:

1. a flexible part-time option for tenured and tenure-track faculty that can be used for up to five years as life-course needs arise
2. a guarantee to make high-quality child care available
3. a commitment to assist new faculty members with spousal/partner employment issues
4. a postdoctoral fellowship program to encourage PhDs who have taken time off from their careers for family reasons to reenter academia
5. instructing faculty committees that family-related gaps in résumés (such as those due to time off for childbirth and/or the postponing of tenure clocks for the same reason) should be discounted in hiring and tenure decisions
6. establishing summer camps and school-break child care for faculty children
7. establishing emergency backup child-care programs
8. establishing benefits for faculty who want to adopt children.

Key aspects of the UC policy include marketing it to potential new hires and building mechanism to ensure that all faculty members at the university, including department chairs, fully understand the policies. Other universities are involved in similar efforts. For example, Princeton has made it mandatory that all faculty members of either gender who have a new child (through birth or adoption) automatically get a year extension on their tenure clocks as a way of eliminating the concern of some female faculty

members that they would be stigmatized in their departments if they had to request such leave. Some institutions have adopted or are considering adopting a wider range of policies including providing funding for child care when faculty members are presenting papers at conferences, developing permanent part-time tenure-track positions, and addressing other family-related issues, such as the serious illness of a faculty member or a faculty member's family, elder care issues and support for faculty facing such problems. Their hope is that, by making their workplace more family friendly, universities will find it easier to attract and retain female faculty.

Their desire to attract and retain female faculty, especially in science and engineering fields, derives at least partially from the belief that if they provide same-gender role models more female students will major in science and engineering, go on to advanced study in these fields and, once enrolled in advanced study, persist to earn their degrees. Evidence to support these beliefs is in fact mixed.⁶ Even if these hypotheses are correct, there is still the question of from where the resources will come to support the creation of these family-friendly policies. It is not an accident that the first research universities to develop them are our nation's wealthiest private and public institutions. It will be more difficult, for example, for universities that currently do not have enough resources to provide meaningful travel funds for their faculty to even dream about being able to provide funding for child care for faculty attending meetings.

In contrast to the large increase in the fraction of PhDs being awarded to American citizens and permanent residents that go to women, the fraction of PhDs being awarded to students from historically under-represented groups is still quite modest, especially in key science and engineering fields. For example, the percentages of American citizen doctoral degrees that went to members of under-represented groups (African-Americans, Hispanic Americans and Native Americans) in 2003 were 6.7 per cent, 8.5 per cent and 8.1 per cent in the physical science, engineering and life science fields respectively (Hoffer et al., 2004, Table 8). The small numbers of members of these groups in faculty positions in American universities is largely a pipeline problem and America's great research universities need to devote more effort to increase the flow of their undergraduate students from under-represented groups into PhD programs (Ehrenberg, 2004a).

INCREASING IMPORTANCE AND COST OF SCIENTIFIC RESEARCH

Advances in modern biology, advanced materials and information sciences, which together promise (and are beginning to deliver) improvements in

human welfare, have led to the growing importance of scientific and engineering research at universities. In spite of generous increases in external funding, the cost of research is increasingly being borne by academic institutions themselves and the start-up-cost packages necessary to attract top young scientists and engineers are now in the \$500 000 area; the start-up-cost packages for senior scientists are often well over \$1 000 000 (Ehrenberg et al., forthcoming). Public universities, more than private universities, indicate that they fund these start-up-cost packages at least partially by keeping faculty positions for scientists and engineers vacant until the salary savings provide the resources needed; this contributes to the growing use of contingent faculty for instructional purposes at public universities (Ehrenberg et al., 2003).

The growth in the demand for scientific research has led to a growth in the demand for scientific researchers that exceeds the growth in demand for faculty to teach science at universities. As a result, we have seen a tremendous expansion in the usage of research assistants, postdoctoral fellows, research associates and senior research associates at universities. At many universities individuals employed in these positions cannot be principle investigators on research grants and some universities are now experimenting with professorial titles (for example, Research Professor) to retain top non-teaching faculty and to allow them to pursue independent research grants. Individuals in these positions are typically not on tenure tracks, so all the issues that arise in terms of improving compensation and job security for contingent teaching faculty also arise here. The compensation of people in these positions is often very similar to the compensation of research faculty in medical colleges; the faculty members are expected to generate research funding to cover most or all of their salaries. How they are treated when their grant funding expires is a major issue in defining these types of appointment.

The growth of scientific enterprise in the US has been fueled by the growing number of foreign PhD students and foreign postdoctoral researchers in the United States. Changes in US policy since 9/11, coupled with the growth of graduate education and research enterprises in foreign countries, make it unclear whether the US can continue to count on attracting the same numbers of these talented foreign PhD students and postdoctoral researchers to our country in the years ahead (Ehrenberg, 2005b). This means that steps must be taken to increase the supply of American students going into PhD study and academic careers and to accomplish this will inevitably require increases in faculty compensation levels, which American colleges and universities will have to bear.

FACULTY COMPENSATION DIFFERENTIALS

Growing faculty salary differential across institutions, across fields within each institution and across faculty members in the same department, as well as growing compensation differences between faculty members who receive income from commercializing their research findings and those who do not, are a fact of life in American higher education. These trends create serious problems for leaders of our universities.

The financial problems faced by public higher education institutions have led to the average salaries of faculty at public doctoral universities falling substantially relative to the average faculty salary at private doctoral universities over the last three decades; this makes it harder for the public universities to recruit and retain top faculty (Ehrenberg, 2003). During periods of relatively modest faculty salary increases in public higher education, efforts by public universities to retain top faculty who have received job offers from other academic institutions contribute to growing salary differentials within departments. This creates strains on academic institutions; if the only way to generate salary increases is to search for an outside offer, faculty commitment to the institution goes down and faculty members' sense of shared purpose is also diminished.

This problem is exacerbated by a widening of salary differentials across fields, which reflects the growing importance of external nonacademic markets in faculty salary determination in higher education. Data from an annual salary survey by field for a set of doctoral-granting institutions (mainly public ones) that has been conducted by the Office of Institutional Research and Information Management at Oklahoma State University since 1974 illustrate the magnitude of this problem. In 2001–2002 the average salaries of new assistant professors in Business Management, Computer and Information Sciences, Economics, Engineering, and Law and Legal Studies were, respectively, 213.5, 169.7, 150.5, 147.1 and 168.2 per cent higher than the average salaries of assistant professors in English (Ehrenberg, 2004b, Table D). Faculty salary differentials by field are smaller at the full professor level and also vary across universities (*ibid.*, Tables C and D). When the quality of the faculty in a field is higher, as measured by the National Research Council ratings of the field at an institution, other factors being held constant, average full professor salaries in the field are higher relative to average full professor salaries in English at the institution (Ehrenberg et al., forthcoming a). Wide and growing faculty salary differentials across fields also contribute to the loss of collegiality at the university.

In fields that are growing in importance and that have substantial nonacademic employment opportunities, the increase in the starting salary for new assistant professors that occurs between two years, which is

determined by market forces at the national level, is sometimes larger than the amount by which the resources of an institution permit the average salary for continuing assistant professors to increase. This leads to a form of salary inversion, with new faculty members earning more than faculty members with a number of years' experience at the institution. Such salary inversion creates incentives for experienced faculty members to look for other employment and also has a negative impact upon faculty morale.

So, too, do efforts to commercialize scientists research findings. The financial rewards from patenting research findings that lead to licensing agreements or the creation of start-up companies is potentially very large for both the university and the faculty member making a discovery.⁷ Researchers are just beginning to sort out how these relationships affect academic culture and the relationships between faculty members in departments in which some faculty members earn large incomes from commercialization of their research findings but others earn none (Stephan and Ehrenberg, forthcoming).

MANDATORY RETIREMENT AND HEALTH INSURANCE ISSUES

The abolition of mandatory retirement for tenured faculty, effective from 1994, has fundamental implications for academia. Studies suggest that the abolition of mandatory retirement has had only a small impact on faculty members' retirement rate, with the largest impact coming at our nation's private research universities (Ashenfelter and Card, 2002; Ehrenberg et al., 2000). However, these studies were undertaken before the dramatic decline in the stock market in 2000; the values of the retirement accounts of many faculty members covered by defined contribution pension plans are barely at the same levels in 2005 that they were five years earlier. As a result, many senior faculty members' expectations about their retirement incomes are lower now than they were five years ago and this may induce some to postpone retirement.

Dramatic increases in health insurance costs are also leading some academic institutions to modify or reduce the generosity of their health insurance coverage for retirees, a trend that is occurring among American employers (Moon, 2005). Unlike pension benefits, which cannot be legally reduced once a faculty member retires, retiree health insurance programs can be altered after retirement (by negotiations if the health benefits are provided through collective bargaining contracts, unilaterally by the university otherwise). Moreover a large number of faculty are employed at academic institutions that do not provide any funding for retiree health

costs; a national survey undertaken by the American Association of University Professors in 2000 found that only 58 per cent of academic institutions contributed to the costs of their faculty retirees' health insurance (Ehrenberg, 2001). Uncertainty about who will pay for their health costs in retirement may well cause many faculty members to postpone their plans for retirement.

The postponement of retirement decision by faculty, as well as the uncertainty of when faculty will retire, imposes costs on academic institutions; new faculty hiring is slowed down and it is difficult to plan for faculty replacements. Academic institutions have altered their retirement programs to provide incentives for faculty to retire (buy-outs and so on) and provided other incentives for faculty to retire, such as opportunities for phased retirement and for retired faculty to teach on a part-time basis (Ehrenberg, 2001). Only recently, however, have they begun to confront the issue of retiree health insurance.

One innovative program has been developed by the Emeriti Consortium for Retirement Health Solutions, a nonprofit company that grew out of a project funded by the Andrew W. Mellon Foundation (Pulley, 2005).⁸ The program combines tax advantages for academic employers and faculty members to contribute to a personal retiree health-care account for a faculty member using before-tax dollars. These funds are invested in selected mutual funds whose investment returns are not subject to personal income taxes. When a faculty member retires, he or she can make tax-free withdrawals from his or her account to cover the costs of Medicare supplemental insurance premiums and out-of-pocket medical expenses, including prescription-drug costs not covered by Medicare.⁹

As of August 2005, 29 academic institutions, primarily private liberal arts colleges, belonged to the consortium and were making contributions to these accounts for their older faculty members; many other institutions have expressed interest in participating in the program. Some participating institutions have their own retiree health insurance plans, but others do not. So another aspect of the program is the establishment of several health insurance options that provide supplementary health insurance coverage designed to supplement Medicare coverage. These programs were designed with faculty members' needs in mind and, by being open to faculty around the nation, can be offered at relatively low costs to individuals.

Recently public attention has been drawn to the difficulty that public and private employers in many industries nationwide are having in financing defined benefit pension plans. In large part these difficulties arise from low rates of stock market returns at the turn of the twenty-first century and, in some industries such as automotives, an increasing ratio of retirees to active employees. As a result, a number of employers are abandoning their

defined benefit plans (which can be done prior to participants retiring) and substituting defined contribution retirement accounts in an effort both to cap their liabilities for retirees' pension benefits and to increase the predictability of what their liabilities for future retirement benefits will be each year.

The Emeriti Consortium for Retirement Health Solutions program may lead to a similar thing occurring with respect to faculty retiree health-care coverage. Faculty at institutions that previously did not fund any retiree health insurance benefits will clearly be better off with such a program, and an institution's adopting it may lead its faculty members to retire earlier than otherwise would be the case. On the other hand, academic institutions that currently contribute to faculty retirees' health insurance costs may see participating in the Emeriti Consortium program as a way of limiting their future liabilities for retiree health-care costs, and they may substitute this defined contribution program for their own current retiree health insurance plan. Such a substitution might increase older faculty members' uncertainty about their future health-care costs and induce them to postpone their retirement dates. Academic administrators will have to think long and hard in the years ahead about the issue of health coverage for retired faculty members.

CONCLUDING REMARKS

As a former Cornell Vice President, I can attest that it is much easier to write about and conduct research on the problems that our nation's academic leaders face, owing to the changing nature of the faculty and faculty employment practices, than it is to actually deal with these problems. Academic leaders are often preoccupied with the short-run academic and financial challenges that they face, and may postpone thinking about the longer-term issues that I have raised. However, this would be a mistake; addressing these issues is essential to the well-being of the academic enterprise. Thoughtful leaders will understand this and devote attention to both thinking about them and designing creative solutions.

ACKNOWLEDGMENTS

The Cornell Higher Education Research Institute (CHERI) is supported by the Andrew W. Mellon Foundation, the Atlantic Philanthropies (USA) Inc. and the TIAA-CREF Institute and I am grateful to them for their support. However, the views expressed here are solely my own.

NOTES

1. The four university centers in the SUNY system are Albany, Binghamton, Buffalo and Stony Brook.
2. A number of the papers in Ehrenberg (forthcoming) present similar data on the growing use of part-time and full-time non-tenure-track faculty in other states' public universities.
3. Professional schools, both at the undergraduate and graduate levels, have long used adjunct faculty members who bring professional expertise to the classroom that their full-time academic colleagues may not have. My concern here is largely with undergraduate students and the substitution of contingent for other faculty in arts and science and other academic areas.
4. In 2005 collective bargaining for graduate assistants at private universities was effectively at least temporarily precluded by the NLRB in its New York University decision.
5. In November 2005 the New School became the first private university to guarantee job security to part-time faculty when it ratified a contract with the union representing its part-time faculty, who make up over 80 per cent of the teaching staff at the institution (Gravois, 2005).
6. Canes and Rosen (1995) found no evidence that the gender composition of departments at three selected academic institutions influenced female undergraduates choice of majors, while Rask and Bailey (2002) and Ashworth and Evans (2001) found that it did. More recently Bettinger and Long (2005) found that having a female faculty member in a class increased the likelihood that female college students would take additional classes in mathematics and geology, but they found no such relationship in engineering, physics and computer science. Finally, Neumark and Gardecki (1998) found that female graduate students in economics were more likely to complete their degrees when they had female mentors.
7. However, Ehrenberg et al. (forthcoming b) find that very few universities are actually making money on their commercialization activities.
8. See also the program's website, www.emertihealth.org, for details.
9. Fronstin and Yakoboski (2005) provide a broader discussion of such retiree medical account programs.
