12-15-42.

Date Ray Walch (owner) Accession No. 27051
From Bridgewater, N.Y. Dr. Schafer
Address Saugusville, N.Y. telephone Utica 2 2670
Breed Bronz turkey No. 2 Age 6 mos
Other Material Dead!

Birds partly decomposed upon arrival.

600 in flock; lost 100 in three

days. Turkeys on open range.

Autopsy: Blood smear showed many organisms of bipolar type staining.

Condition of birds — very good flesh.

Crop: 1 bird had wheat and corn in crop. Other bird crop was empty and mucosa was inflamed.

Diagnosis

Avian cholera

Reported. Date

12-15-42 By phone EBB

Gizzard: lining of gizzard stripped easily
few ecchymotic hemorrhages on
mucosal surface.

Proventriculus: ^{mucosa} covered with a sticky
exudate; after washing this exudate
off, petechial hemorrhages were
found. These petechial hemorrhages
were present in both birds and
were very marked. The petechia
were concentrated most just at
the junction with the gizzard.

Intestine: The entire intestine ^{mucosa} was covered
with a sticky exudate which was
difficult to wash off. In one intestine
there was in addition, much watery fluid in
the intestine and a more marked
inflammation (the intestinal lining
appeared reddened).

Ovary: In both birds the ovary was markedly
hemorrhagic.

Oviduct: In one bird - normal; In other bird, there
were many petechial hemorrhages, particularly
on the ovarian mesentery.

Heart: Petechia only on auricles of heart.

Liver: ~~Swollen~~. Swollen with grey, pinpoint necrotic
foci.

Date 2-3-43 Accession No. 27152

From Robert H. Sears

Address Mayville, N.Y.

Breed — No. — Age —

Other Material 252 turkey blood samples
tested by the tube method for
pullorum agglutinins. 1:40 dilution
was used.

The following birds were considered
reactors: 75 strong reaction

177 strong reaction

155 weak "

147 weak "

The reactors were tested twice, but only one
dilution (1:40) was used since sufficient serum for
Diagnosis the multiple tube test could not be obtained.
